

Access to VBA code will last forever

April, 2009. Passcovery Ltd. announces the release of a new edition of a VBA password recovery solution for Microsoft Office documents - Atomic VBA Password Recovery. The new edition has new interface but is still retaining reliable features for instant recovery of VBA passwords.

Microsoft Office is a de facto standard package of applications creating text-based documents, spreadsheets and simple databases. The possibilities of the package are extended by VBA macros created with the integrated programming language Visual Basic for Applications – VBA. Using VBA macros in Microsoft Word, Excel or Access requires the highest mastery of the subject and programming specialists are often involved. It is only natural that VBA codes are password protected. Despite the good reason – to protect the code from accidental or deliberate damage, still there is a downside: a VBA password may get lost or forgotten which would leave you with no access to your VBA code.

Passcovery Ltd. announces the release of a new edition of their VBA password recovery solution for Microsoft Office documents - Atomic VBA Password Recovery. The new edition features a number of modifications allowing us to have no doubts that you will access to your VBA code forever.

The main advantages of Atomic VBA Password Recovery: instant and guaranteed result. No matter what edition of Microsoft Office your VBA project was created with the password will be restored instantly at the launch of the program.
